## Chapter 4: Arithmetic for Computers

[with materials from *COD, RISC-V 2<sup>nd</sup> Edition*, Patterson & Hennessy 2021,  
and M.J. Irwin's presentation, PSU 2008,  
The RISC-V Instruction Set Manual, Volume I, ver. 2.2]

# What are stored inside computer?

---

- ❑ Data, of course!
  - | Audio, video, image, drawings,...
  - | Documents, personal information,...
  - | Finance record, corporate business data,...
  - | ...
- ❑ Complex data is constructed from basic data types.
  - | Integers
  - | Real numbers (Floating point)
  - | Symbols (Characters)
- ❑ All are represented as binary numbers.

# Content

---

- ❑ (Super) Basics of logic design
- ❑ Integer representation
- ❑ Integer arithmetic (inside computer)
- ❑ Floating point number representation and arithmetic

# Unsigned Binary Integers

---

- ❑ Using n-bit binary number to represent non-negative integer

$$\begin{aligned} X &= X_{n-1}X_{n-2}\dots X_1X_0 \\ &= X_{n-1}2^{n-1} + X_{n-2}2^{n-2} + \dots + X_12^1 + X_02^0 \end{aligned}$$

- ❑ **Range: 0 to  $+2^n - 1$**

- ❑ **Example**

$$\begin{aligned} &0000\ 0000\ 0000\ 0000\ 0000\ 0000\ 0000\ 1011_2 \\ &= 0 + \dots + 1 \times 2^3 + 0 \times 2^2 + 1 \times 2^1 + 1 \times 2^0 \\ &= 0 + \dots + 8 + 0 + 2 + 1 = 11_{10} \end{aligned}$$

- ❑ **Data range using 32 bits**

$$0 \text{ to } 2^{32}-1 = 4,294,967,295$$

## Eg: 32 bit Unsigned Binary Integers

---

| Hex        | Binary   | Decimal    |
|------------|----------|------------|
| 0x00000000 | 0...0000 | 0          |
| 0x00000001 | 0...0001 | 1          |
| 0x00000002 | 0...0010 | 2          |
| 0x00000003 | 0...0011 | 3          |
| 0x00000004 | 0...0100 | 4          |
| 0x00000005 | 0...0101 | 5          |
| 0x00000006 | 0...0110 | 6          |
| 0x00000007 | 0...0111 | 7          |
| 0x00000008 | 0...1000 | 8          |
| 0x00000009 | 0...1001 | 9          |
|            | ...      |            |
| 0xFFFFFFF0 | 1...1111 | $2^{32}-1$ |
| 0xFFFFFFF1 | 1...1110 | $2^{32}-2$ |
| 0xFFFFFFF2 | 1...1101 | $2^{32}-3$ |
| 0xFFFFFFF3 | 1...1100 | $2^{32}-4$ |

## Exercise

---

- ❑ Convert from decimal to 32-bit binary integers

25 = 0000 0000 0000 0000 0000 0000 0001 1001

125 = 0000 0000 0000 0000 0000 0000 0111 1101

255 = 0000 0000 0000 0000 0000 0000 1111 1111

- ❑ Convert 32-bit binary integers to decimal

0000 0000 0000 0000 0000 0000 1100 1111 = 207

0000 0000 0000 0000 0000 0001 0011 0011 = 307

# Signed binary integers

- Using n-bit binary number to represent integer, including negative values

$$\begin{aligned} X &= X_{n-1}X_{n-2}\dots X_1X_0 \\ &= -X_{n-1}2^{n-1} + X_{n-2}2^{n-2} + \dots + X_12^1 + X_02^0 \end{aligned}$$

- Range:  $-2^{n-1}$  to  $+2^{n-1} - 1$
- The left most bit (msb) indicates the sign of the number

- Example

$$\begin{aligned} &1111\ 1111\ 1111\ 1111\ 1111\ 1111\ 1111\ 1100_2 \\ &= -1 \times 2^{31} + 1 \times 2^{30} + \dots + 1 \times 2^2 + 0 \times 2^1 + 0 \times 2^0 \\ &= -2,147,483,648 + 2,147,483,644 = -4_{10} \end{aligned}$$

- Using 32 bits

## Signed integer negation

---

□ Given  $x = x_{n-1}x_{n-2} \dots x_1x_0$ , how to calculate  $-x$ ?

□ Let  $\bar{x} = 1$ 's complement of  $x$

$$\bar{x} = 1111 \dots 11_2 - x$$

$$(1 \rightarrow 0, 0 \rightarrow 1)$$

Then

$$\bar{x} + x = 1111 \dots 11_2 = -1$$

$$\rightarrow \bar{x} + 1 = -x$$

□ The computer uses 2's complement form to represent a negative number

□ Example: find binary representation of -2

$$+2 = 0000 \ 0000 \dots 0010_2$$

$$-2 = 1111 \ 1111 \dots 1101_2 + 1$$

$$= 1111 \ 1111 \dots 1110_2$$

## Exercise

---

❑ Find 16 bit signed integer representation of

$$16 = 0000\ 0000\ 0001\ 0000$$

$$-16 = 1111\ 1111\ 1111\ 0000$$

$$100 = 0000\ 0000\ 0110\ 0100$$

$$-100 = 1111\ 1111\ 1001\ 1100$$

## Sign extension

---

- ❑ Given n-bit integer  $x = x_{n-1}x_{n-2} \dots x_1x_0$
- ❑ Find corresponding m-bit representation ( $m > n$ ) with the same numeric value

$$x = x_{m-1}x_{m-2} \dots x_1x_0$$

- ❑ → Replicate the sign bit to the left

- ❑ Examples: 8-bit to 16-bit

+2: 0000 0010 => 0000 0000 0000 0010

-2: 1111 1110 => 1111 1111 1111 1110

## Instruction to work with sign/unsigned

---

- ❑ lb/lbu, lh/lhu
- ❑ blt/bltu, bge/bgeu
- ❑ slt/sltu, slti/sltiu
- ❑ div/divu, rem/remu

## Example

---

- ❑ What is the output of the following program?
- ❑ What if the blt instruction is replaced by bltu?

```
        li t0, 20
        li t1, -20
        bltu t1, t0, else
        li a0, 1
        j print
else:
        li a0, 0
print:
        li a7, 1
        ecall
```

## Example

---

- ❑ What are the decimal values of s0, s1, s2, s3?

```
.data
    x: .byte 20
    y: .byte -20
.text
    la t0, x
    la t1, y
    lb  s0, 0(t0)
    lbu s1, 0(t0)
    lb  s2, 0(t1)
    lbu s3, 0(t1)
```

# Addition and subtraction

---

## □ Addition

- | Similar to what you do to add two numbers manually
- | Digits are added bit by bit from right to left
- | Carries passed to the next digit to the left

## □ Subtraction

- | Negate the second operand then add to the first operand

$$\begin{array}{r} + \quad 0000 \ 0000 \ 0000 \ 0000 \ 0000 \ 0000 \ 0000 \ 0111_{\text{two}} = 7_{\text{ten}} \\ \quad 0000 \ 0000 \ 0000 \ 0000 \ 0000 \ 0000 \ 0000 \ 0110_{\text{two}} = 6_{\text{ten}} \\ \hline \quad 0000 \ 0000 \ 0000 \ 0000 \ 0000 \ 0000 \ 0000 \ 1101_{\text{two}} = 13_{\text{ten}} \end{array}$$

# Carryout and Overflow

- ❑ Carryout: adding or subtracting n-bit binary numbers result in carryout to or borrow from bit n+1.
- ❑ Overflow: adding or subtracting n-bit signed integers result in a value that cannot be represented by a n-bit signed integer.
  - ❑ When adding operands with different signs or when subtracting operands with the same sign, overflow can *never* occur

| Operation | Operand A | Operand B | Result indicating overflow |
|-----------|-----------|-----------|----------------------------|
| A + B     | $\geq 0$  | $\geq 0$  | $< 0$                      |
| A + B     | $< 0$     | $< 0$     | $\geq 0$                   |
| A - B     | $\geq 0$  | $< 0$     | $< 0$                      |
| A - B     | $< 0$     | $\geq 0$  | $\geq 0$                   |

# Overflow consequences

---

- ❑ Incorrect results: the result may
  - | wrap around (unsigned numbers), or
  - | change sign (signed numbers)
- ❑ Hardware exception:
  - | In Intel x86: the **overflow flag** (a specific bit in a global **flag register**) is set when overflow occurs, allowing software to detect it.
  - | In RISC-V: hardware does not care about the overflow → must be handled explicitly by software

## Examples

---

- ❑ All numbers are 8-bit signed integer

$$12 + 8 =$$

$$122 + 8 =$$

$$122 + 80 =$$

$$122 - 80 =$$

# Arithmetic from hardware viewpoint

---

- ❑ How does computer implement the addition by hardware?
  - | Answer: the computer implements **logic circuits**
  - | Logic circuits are built using **logic gates**: AND, OR, NOT
  - | Supported theory: Boolean algebra

## Basics of logic design (Appendix A)

---

- ❑ Boolean logic: logic variable and operators
- ❑ Logic variable: values of 1 (TRUE) or 0 (FALSE)
- ❑ Basic operators: AND, OR, NOT
  - | A AND B :  $A \cdot B$  hay  $AB$
  - | A OR B :  $A + B$
  - | NOT A :  $\overline{A}$
  - | Order: NOT > AND > OR
- ❑ Additional operators: NAND, NOR, XOR
  - | A NAND B :  $\overline{A \cdot B}$
  - | A NOR B :  $\overline{A + B}$
  - | A XOR B :  $A \oplus B = A \bullet \overline{B} + \overline{A} \bullet B$

# Truth tables

| A | B | A AND B<br>$A \bullet B$ |
|---|---|--------------------------|
| 0 | 0 | 0                        |
| 0 | 1 | 0                        |
| 1 | 0 | 0                        |
| 1 | 1 | 1                        |

| A | B | A OR B<br>$A + B$ |
|---|---|-------------------|
| 0 | 0 | 0                 |
| 0 | 1 | 1                 |
| 1 | 0 | 1                 |

| 0    | 1                                                                                   | 1                                    |                                                                                                                                                                                                                    |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |
| 1    | 0                                                                                   | 1                                    |                                                                                                                                                                                                                    |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |
| 1    | 1                                                                                   | 0                                    |                                                                                                                                                                                                                    |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |

# Laws of Boolean algebra

$$A \cdot B = B \cdot A$$

$$A \cdot (B + C) = (A \cdot B) + (A \cdot C)$$

$$1 \cdot A = A$$

$$A \cdot \bar{A} = 0$$

$$0 \cdot A = 0$$

$$A \cdot A = A$$

$$A \cdot (B \cdot C) = (A \cdot B) \cdot C$$

$$\overline{A \cdot B} = \bar{A} + \bar{B} \text{ (DeMorgan's law)}$$

$$A + B = B + A$$

$$A + (B \cdot C) = (A + B) \cdot (A + C)$$

$$0 + A = A$$

$$A + \bar{A} = 1$$

$$1 + A = 1$$

$$A + A = A$$

$$A + (B + C) = (A + B) + C$$

$$\overline{A + B} = \bar{A} \cdot \bar{B} \text{ (DeMorgan's law)}$$

## Example: multiplexor

- ❑ Depending on  $S$ , output  $C$  is equal to one of the two inputs  $A$ ,  $B$
- ❑ Explain how this circuit works?

# Multiplexor explanation

MUX 2-1

$$S = C_{in} \oplus (A \oplus B)$$

$$C_{out} = AB + BC_{in} + AC_{in}$$

# Adder implementation

## ❑ N-bit ripple-carry adder

Performance depends  
on data length

➔ Performance is low

## Making addition faster: infinite hardware

❑ Parallelize the adder with the cost of hardware

❑ Given the addition:

$$a_{n-1}a_{n-2} \dots a_1a_0 + b_{n-1}b_{n-2} \dots b_1b_0$$

❑ Let  $c_i$  is the carry at bit  $i$

$$c_2 = (b_1 \cdot c_1) + (a_1 \cdot c_1) + (a_1 \cdot b_1)$$

$$c_1 = (b_0 \cdot c_0) + (a_0 \cdot c_0) + (a_0 \cdot b_0)$$

Find  $c_2$  from  $a_0, b_0, a_1, b_1$ ?

# Making addition faster: Carry Lookahead

---

❑ Video demo:

<https://www.youtube.com/watch?v=yj6wo5SCObY>

❑ Approach

- | Make hardwired 4 bit adder → fast and simple enough
- | Develop a carry lookahead unit to calculate the carry bit before finishing the addition

❑ At bit  $i$

$$\begin{aligned} c_{i+1} &= (b_i \cdot c_i) + (a_i \cdot c_i) + (a_i \cdot b_i) \\ &= (a_i \cdot b_i) + (a_i + b_i) \cdot c_i \end{aligned}$$

$$g_i = a_i \cdot b_i$$

$$p_i = a_i + b_i$$

❑ Denote

$$c_{i+1} = g_i + p_i \cdot c_i$$

❑ Then

# Carry lookahead

---

## ❑ With 4-bit adder

$$c1 = g0 + (p0 \cdot c0)$$

$$c2 = g1 + (p1 \cdot g0) + (p1 \cdot p0 \cdot c0)$$

$$c3 = g2 + (p2 \cdot g1) + (p2 \cdot p1 \cdot g0) + (p2 \cdot p1 \cdot p0 \cdot c0)$$

$$c4 = g3 + (p3 \cdot g2) + (p3 \cdot p2 \cdot g1) + (p3 \cdot p2 \cdot p1 \cdot g0) \\ + (p3 \cdot p2 \cdot p1 \cdot p0 \cdot c0)$$

- ➔ All carry bits can be calculated after 3 gate delay
- ➔ All result bits can be calculated after maximum of 4 gate delay
- ➔ How to implement bigger adder?

# Carry lookahead

---

- ❑ For 16-bit adder  $\rightarrow$  fast C1, C2, C3, C4 is needed

# Carry lookahead

---

## □ Denote

$$\begin{array}{ll} P_0 = p_3 \cdot p_2 \cdot p_1 \cdot p_0 & G_0 = g_3 + (p_3 \cdot g_2) + (p_3 \cdot p_2 \cdot g_1) + (p_3 \cdot p_2 \cdot p_1 \cdot g_0) \\ P_1 = p_7 \cdot p_6 \cdot p_5 \cdot p_4 & G_1 = g_7 + (p_7 \cdot g_6) + (p_7 \cdot p_6 \cdot g_5) + (p_7 \cdot p_6 \cdot p_5 \cdot g_4) \\ P_2 = p_{11} \cdot p_{10} \cdot p_9 \cdot p_8 & G_2 = g_{11} + (p_{11} \cdot g_{10}) + (p_{11} \cdot p_{10} \cdot g_9) + (p_{11} \cdot p_{10} \cdot p_9 \cdot g_8) \\ P_3 = p_{15} \cdot p_{14} \cdot p_{13} \cdot p_{12} & G_3 = g_{15} + (p_{15} \cdot g_{14}) + (p_{15} \cdot p_{14} \cdot g_{13}) + (p_{15} \cdot p_{14} \cdot p_{13} \cdot g_{12}) \end{array}$$

## □ Then big-carry bits can be calculated fast

$$\begin{aligned} C_1 &= G_0 + (P_0 \cdot c_0) \\ C_2 &= G_1 + (P_1 \cdot G_0) + (P_1 \cdot P_0 \cdot c_0) \\ C_3 &= G_2 + (P_2 \cdot G_1) + (P_2 \cdot P_1 \cdot G_0) + (P_2 \cdot P_1 \cdot P_0 \cdot c_0) \\ C_4 &= G_3 + (P_3 \cdot G_2) + (P_3 \cdot P_2 \cdot G_1) + (P_3 \cdot P_2 \cdot P_1 \cdot G_0) \\ &\quad + (P_3 \cdot P_2 \cdot P_1 \cdot P_0 \cdot c_0) \end{aligned}$$

# 16-bit Adder

# Multiply

- Binary multiplication is just a *bunch* of right shifts and adds

*$n$ -bit multiplicand and multiplier  $\rightarrow 2n$ -bit product*

## Example

---

$$\begin{array}{r} \text{Multiplicand} \qquad 1000_{\text{ten}} \\ \text{Multiplier} \quad \times \quad 1001_{\text{ten}} \\ \hline \qquad 1000 \\ \qquad 0000 \\ \qquad 0000 \\ \qquad 1000 \\ \hline \text{Product} \quad 1001000_{\text{ten}} \end{array}$$

*How to do this in hardware?*

# Add and Right Shift Multiplier

# Add and Right Shift Multiplier Hardware

|     |           |         |                          |
|-----|-----------|---------|--------------------------|
|     | 0 0 0 0   | 0 1 0 1 | = 5                      |
| add | 0 1 1 0   | 0 1 0 1 | LSB=1 → add multiplicand |
|     | 0 0 1 1 → | 0 0 1 0 | shift right              |
| add | 0 0 1 1   | 0 0 1 0 | LSB=0 → no change        |
|     | 0 0 0 1 → | 1 0 0 1 | shift right              |
| add | 0 1 1 1   | 1 0 0 1 | LSB=1 → add multiplicand |
|     | 0 0 1 1 → | 1 1 0 0 | shift right              |
| add | 0 0 1 1   | 1 1 0 0 | LSB=0 → no change        |
|     | 0 0 0 1 → | 1 1 1 0 | shift right              |
|     |           |         | = 30                     |

# Fast multiplier – Design for Moore

❑ Why is this fast?

# Fast multiplier – Design for Moore

- ❑ How fast is this?
- ❑ Note: the size of addition circuits

## RISC-V Multiply Instruction (RV32M extension)

❑ Multiply instructions: `mul`, `mulh`, `mulhu`, `mulhsu`

`mul t1, s0, s1` #set `t1` to lower 32 bits  
of `s0 * s1`

`mulh t1, s0, s1` #set `t1` to upper 32 bits  
of `s0 * s1`

`mulhu t1, s0, s1` #set `t1` to upper 32 bits of  
`s0 * s1` (unsigned multiplication)

`mulhsu t1, s0, s1` #set `t1` to upper 32 bits  
of `s0 * s1`, where `s0` is signed and `s1` is  
unsigned

# Division

- Division is just a *bunch* of quotient digit guesses and left shifts and subtracts

$$\text{dividend} = \text{quotient} \times \text{divisor} + \text{remainder}$$

# Left Shift and Subtract Division Hardware

|     |         |   |         |
|-----|---------|---|---------|
|     | 0 0 0 0 | ← | 1 1 0 0 |
| sub | 1 1 1 0 |   | 1 1 0 0 |
|     | 0 0 0 0 |   | 1 1 0 0 |
|     | 0 0 0 1 | ← | 1 0 0 0 |
| sub | 1 1 1 1 |   | 1 0 0 0 |
|     | 0 0 0 1 |   | 1 0 0 0 |
|     | 0 0 1 1 | ← | 0 0 0 0 |
| sub | 0 0 0 1 |   | 0 0 0 1 |
|     | 0 0 1 0 | ← | 0 0 1 0 |
| sub | 0 0 0 0 |   | 0 0 1 1 |

rem < 0, so quotient bit = 0  
and restore remainder

rem < 0, so quotient bit = 0  
and restore remainder

rem ≥ 0, so quotient bit = 1

rem ≥ 0, so quotient bit = 1  
all bits of dividend are processed

**Result: remainder 0, quotient 3**

## RISC-V Divide Instruction (RV32M extension)

---

### ❑ Instructions:

`div t1, t2, t3 #t1 = t2/t3 (signed division)`

`divu t1, t2, t3 #t1 = t2/t3 (unsigned division)`

`rem t1, t2, t3 #t1 = remainder of t2/t3`

`remu t1, t2, t3 #t1 = remainder of t2/t3  
(unsigned)`

- ❑ As with multiply, divide ignores overflow so software must determine if the quotient is too large.
- ❑ Software must also check the divisor to avoid division by 0.

# Signed integer multiplication and division

---

- ❑ Reuse unsigned multiplication then fix product sign later
- ❑ Multiplication
  - | Multiplicand and multiplier are of the same sign: keep product
  - | Multiplicand and multiplier are of different sign: negate product
- ❑ Division:
  - | Dividend and divisor of the same sign:
    - Keep quotient
    - Keep/negate remainder so it is of the same sign with dividend
  - | Dividend and divisor of different sign:
    - Negate quotient
    - Keep/negate remainder so it is of the same sign with dividend

## Example

---

- ❑ Write a RISC-V program
  - | Reads 2 integers a and b from console
  - | Print out the two values: (a / b) and (a % b) to console

## Exercise

---

- ❑ Write a program that
  - | Reads two integers  $a$  and  $b$  from console.
  - | Find and print out the greatest common divisor of  $a$  and  $b$ .
  - | Find and print out the least common multiplier of  $a$  and  $b$ .

## Representing Big (and Small) Numbers

- ❑ Encoding non-integer value?

- [illegible]

PI number

$$\text{PI} = 3.14159\dots$$

❑ Problem: how to represent the above numbers?

➔ We need reals or floating-point numbers!

➔ Floating point numbers in decimal:

→ 1000

→  $1 \times 10^3$

→  $0.1 \times 10^4$

# Floating point number

---

- ❑ In decimal system

$$2013.1228 = 201.31228 * 10$$

$$= 20.131228 * 10^2$$

$$= 2.0131228 * 10^3$$

$$= 20131228 * 10^{-4}$$

- ❑ What is the “standard” form?

$$2.0131228 * 10^3 = \underline{2.0131228} \text{E} \underline{+03}$$

mantissa

exponent

- ❑ In binary  $X = \pm 1.xxxxx * 2^{yyyy}$

- ❑ ***Sign, mantissa, and exponent need to be represented***

# Floating point number

---

- ❑ Defined by the IEEE 754-1985 standard
  - ❑ Single precision: 32 bit
  - ❑ Double precision: 64 bit
  - ❑ Correspond to float and double in C
- ❑ Single precision floating point representation

$$(-1)^{\text{sign}} \times 1.F \times 2^{E-\text{bias}}$$

- ❑ Fit everything in 32 bits
- ❑ Bias = 127 (with single precision)

**1 sign bit**

**8 bits**

**23 bits**

## Examples

---

❑ Ex1: convert X into decimal value

$X = 1\textcolor{red}{100}\textcolor{red}{0001}\textcolor{red}{0}101\ 0110\ 0000\ 0000\ 0000\ 0000$

**sign = 1  $\rightarrow$  X is negative**

**E = 1000 0010 = 130**

**F = 10101100...00**

**$\rightarrow X = (-1)^1 \times 1.101011000..00 \times 2^{130-127}$**

**$= -1.101011 \times 2^3 = -1101.011$**

**$= -13.375$**

## Example

---

❑ Ex2: find decimal value of X

X = 0011 1111 1000 0000 0000 0000 0000 0000

**sign = 0**

**E = 0111 1111 = 127**

**F = 000...0000 (23 bit 0)**

**$X = (-1)^0 \times 1.00...000 \times 2^{127-127} = 1.0$**

## Example

---

- Ex3: find binary representation of  $X = 9.6875$  in IEEE 754 single precision

### Converting X to plain binary

$$9_{10} = 1001_2$$

$$0.6875 \times 2 = 1.375 \quad \rightarrow \text{get bit } 1$$

$$0.375 \times 2 = 0.75 \quad \rightarrow \text{get bit } 0$$

$$0.75 \times 2 = 1.5 \quad \rightarrow \text{get bit } 1$$

$$0.5 \times 2 = 1.0 \quad \rightarrow \text{get bit } 1$$

$$\rightarrow 9.6875_{10} = 1001.1011_2$$

## Example

---

- Ex3: find binary representation of  $X = 9.6875$  in IEEE 754 single precision

$$X = 9.6875_{(10)} = 1001.1011_{(2)} = 1.0011011 \times 2^3$$

*Then*

$$S = 0$$

$$E = 127 + 3 = 130_{(10)} = 1000\ 0010_{(2)}$$

$$F = 001101100\dots00 \text{ (23 bit)}$$

*Finally*

$$X = 0100\ 0001\ 0001\ 1011\ 0000\ 0000\ 0000\ 0000$$

## Examples

---

□  $1.0_2 \times 2^{-1} =$

□  $100.75_{10} =$

## Some special values

---

- ❑ Smallest+: 0 00000001 1.00000000000000000000000000000000  
=  $1 \times 2^{1-127}$
- ❑ Zero: 0 00000000 00000000000000000000000000000000  
= true 0
- ❑ Largest+: 0 11111110 1.11111111111111111111111111111111  
=  $(2-2^{-23}) \times 2^{254-127}$

## Too large or too small values

- ❑ **Overflow** (floating point) happens when a positive exponent becomes too large to fit in the exponent field
- ❑ **Underflow** (floating point) happens when a negative exponent becomes too large to fit in the exponent field

- ❑ **Double precision: 64 bits**

## Too large or too small values

---

### ❑ Question:

- ❑ How to represent a number less than  $2^{-127}$ ?

### ❑ Answers: use de-normalized representation

- ❑ All bits of E are zero: 00000000
- ❑ One bit of M is not zero, i.e., F is nonzero
- ❑ Value representation:

$$0.\text{fraction} \times 2^{-126}$$

# IEEE 754 FP Standard Encoding

- ❑ Special encodings are used to represent unusual events
  - ❑  $\pm$  infinity for division by zero
  - ❑ NaN (not a number) for invalid operations such as 0/0
  - ❑ True zero is the bit string all zero

| Single Precision       |          | Double Precision            |          | Object Represented          |
|------------------------|----------|-----------------------------|----------|-----------------------------|
| E (8)                  | F (23)   | E (11)                      | F (52)   |                             |
| 0000 0000              | 0        | 0000 ... 0000               | 0        | true zero (0)               |
| 0000 0000              | nonzero  | 0000 ... 0000               | nonzero  | $\pm$ denormalized number   |
| 0111 1111 to +127,-126 | anything | 0111 ...1111 to +1023,-1022 | anything | $\pm$ floating point number |
| 1111 1111              | + 0      | 1111 ... 1111               | - 0      | $\pm$ infinity              |
| 1111 1111              | nonzero  | 1111 ... 1111               | nonzero  | not a number (NaN)          |

# Floating Point Addition

---

## □ Addition (and subtraction)

$$(\pm F1 \times 2^{E1}) + (\pm F2 \times 2^{E2}) = \pm F3 \times 2^{E3}$$

- **Step 0: Restore the hidden bit in F1 and in F2**
- **Step 1: Align fractions by right shifting F2 by  $E1 - E2$  positions (assuming  $E1 \geq E2$ ) keeping track of (three of) the bits shifted out in G R and S**
- **Step 2: Add the resulting F2 to F1 to form F3**
- **Step 3: Normalize F3 (so it is in the form 1.XXXXXX ...)**
  - If F1 and F2 have the same sign  $\rightarrow F3 \in [1,4) \rightarrow$  1 bit right shift F3 and increment  $E3$  (check for overflow)
  - If F1 and F2 have different signs  $\rightarrow$  F3 may require *many* left shifts each time decrementing  $E3$  (check for underflow)
- **Step 4: Round F3 and possibly normalize F3 again**
- **Step 5: Rehide the most significant bit of F3 before storing the result**

# Floating Point Addition Example

---

□ Add

$$(0.5 = 1.0000 \times 2^{-1}) + (-0.4375 = -1.1100 \times 2^{-2})$$

□ Step 0:

□ Step 1:

□ Step 2:

□ Step 3:

□ Step 4:

□ Step 5:

# Floating Point Addition Example

---

❑ Add:  $0.5 + (-0.4375) = ?$

$$(0.5 = 1.0000 \times 2^{-1}) + (-0.4375 = -1.1100 \times 2^{-2})$$

- ❑ **Step 0:** Hidden bits restored in the representation above
- ❑ **Step 1:** Shift significand with the smaller exponent (1.1100) right until its exponent matches the larger exponent (so once)
- ❑ **Step 2:** Add significands  
$$1.000 + (-0.111) = 1.000 - 0.111 = 0.001$$
- ❑ **Step 3:** Normalize the sum, checking for exponent over/underflow  
$$0.001 \times 2^{-1} = 0.010 \times 2^{-2} = .. = 1.000 \times 2^{-4}$$
- ❑ **Step 4:** The sum is already rounded, so we're done
- ❑ **Step 5:** Rehide the hidden bit before storing

# Floating Point Multiplication

---

## ❑ Multiplication

$$(\pm F1 \times 2^{E1}) \times (\pm F2 \times 2^{E2}) = \pm F3 \times 2^{E3}$$

- ❑ **Step 0: Restore the hidden bit in F1 and in F2**
- ❑ **Step 1: Add the two (biased) exponents and subtract the bias from the sum, so  $E1 + E2 - 127 = E3$**   
also determine the sign of the product (which depends on the sign of the operands (most significant bits))
- ❑ **Step 2: Multiply F1 by F2 to form a double precision F3**
- ❑ **Step 3: Normalize F3 (so it is in the form 1.XXXXXX ...)**
  - Since F1 and F2 come in normalized  $\rightarrow F3 \in [1,4) \rightarrow$  1 bit right shift F3 and increment E3
  - Check for overflow/underflow
- ❑ **Step 4: Round F3 and possibly normalize F3 again**
- ❑ **Step 5: Rehide the most significant bit of F3 before storing the result**

# Floating Point Multiplication Example

---

## ❑ Multiply

$$(0.5 = 1.0000 \times 2^{-1}) \times (-0.4375 = -1.1100 \times 2^{-2})$$

❑ **Step 0:**

❑ **Step 1:**

❑ **Step 2:**

❑ **Step 3:**

❑ **Step 4:**

❑ **Step 5:**

# Floating Point Multiplication Example

---

## ❑ Multiply

$$(0.5 = 1.0000 \times 2^{-1}) \times (-0.4375 = -1.1100 \times 2^{-2})$$

❑ **Step 0:** Hidden bits restored in the representation above

❑ **Step 1:** Add the exponents (not in bias would be  $-1 + (-2) = -3$  and in bias would be  $(-1+127) + (-2+127) - 127 = (-1 -2) + (127+127-127) = -3 + 127 = 124$ )

❑ **Step 2:** Multiply the significands

$$1.000 \times 1.110 = 1.110000$$

❑ **Step 3:** Normalized the product, checking for exp over/underflow

$$1.110000 \times 2^{-3} \text{ is already normalized}$$

❑ **Step 4:** The product is already rounded, so we're done

❑ **Step 5:** Rehide the hidden bit before storing

# Support for Accurate Arithmetic

---

- ❑ Rounding (except for truncation) requires the hardware to include extra F bits during calculations
  - ❑ Guard and Round bit – 2 additional bits to increase accuracy
  - ❑ Sticky bit – used to support **Round to nearest even**; is set to a 1 whenever a 1 bit shifts (right) through it (e.g., when aligning F during addition/subtraction)

**F** = **1** . xxxxxxxxxxxxxxxxxxxxxxxxxxxx **G R S**

- ❑ IEEE 754 FP rounding modes
  - ❑ Always round up (toward  $+\infty$ )
  - ❑ Always round down (toward  $-\infty$ )
  - ❑ Truncate
  - ❑ **Round to nearest even** (when the Guard || Round || Sticky are 100) – always creates a 0 in the least significant (kept) bit of F

<http://pages.cs.wisc.edu/~markhill/cs354/Fall2008/notes/flpt.apprec.html>

## Example

---

❑ Calculate:

$$0.2 \times 5 = ?$$

$$0.333 \times 3 = ?$$

$$(1.0/3) \times 3 = ?$$

## Exercise

---

- ❑ Write the corresponding RISC-V assembly program equivalent to the following C code:

```
float x = 0.75;  
printf("%f", x);
```

## Solution

---

**.data**

**x: .float 0.75**

**.text**

**la t1, x**

**flw ft0, 0(t1)                      #load x from mem**

**li a7, 2                      #function 2**

**fcvt.s.w ft1, zero              #zero immediate**

**fadd.s fa0, ft0, ft1            #move data to fa0**

**ecall                      #print**
